ABSTRACT: *Jacobaea vulgaris* Gaertn. subsp. *gotlandica* (Neum.) B. Nord. was regarded as endemic to the Swedish islands Öland and Gotland. However, recent research of diagnostic characters which define infraspecific taxa within the *J. vulgaris* group revealed that *J. vulgaris* subsp. *gotlandica* is more widespread in Europe (Russia, Austria and Greece) than previously thought. By revision of herbarium specimens of the *J. vulgaris* group from herbarium collections BEOU, CAME and APP it is confirmed that *J. vulgaris* subsp. *gotlandica* grows also in Italy and Montenegro, which represent new subspecies for these two countries. In this paper we present detailed chorological data as well as a distribution map of *J. vulgaris* subsp. *gotlandica* in the Apennine and the Balkan peninsula.

KEY WORDS: *Jacobaea vulgaris* subsp. *gotlandica*, Italy, Montenegro, distribution

Received 29 March 2012

Revision accepted 23 August 2012

UDK

Jacobaea vulgaris Gaertn. is a species widely distributed in Europe and further east in Russia and West and Central Asia. It is a biennial or perennial herb growing mostly in open habitats on sand or gravel, on hill slopes or stony shores, dry meadows, in waste agricultural fields, on roadsides or other ruderal habitats. According to GREUTER & RAAB-STRABE (2008) within this species there are two accepted subspecies: *J. vulgaris* subsp. *dunensis* (Dumort.) Pelser & Meijden distributed in Belgium, Great Britain, Denmark, Germany, Ireland, Netherlands, Norway, Poland and Sweden and *J. vulgaris* subsp. *gotlandica* (Neum.) B. Nord. (syn. *Senecio jacobaea* L. var. *gotlandicus* Neum.) a biennial or short-lived perennial, which is considered to be endemic to Öland and Gotland in Sweden where it grows on calcareous flat bedrock with a thin soil layer. However, recent research based on nrITS and *trnT-trnL* intergenic spacer sequences, revealed that *J. vulgaris* subsp. *gotlandica* is a distinct evolutionary lineage more widespread in Europe (Russia, Austria and Greece) than previously thought, and may be considered a southeastern

European floristic element with outliers on the large Baltic islands (WYSK *et al.* 2009). In WISK *et al.* (2009) diagnostic characters with related taxa (*J. vulgaris* subsp. *vulgaris* and *J. aquatica*) have been better defined. In the light of this paper we revise our specimens and we attributed the following to *J. vulgaris* subsp. *gotlandica*.

Specimina visa:

Italy

Abruzzo, Piani di Pezza (Rocca di Mezzo), 42°10.879'N, 13°29.023'E, UTM-ED50, 1480 m, pascoli, (F. Conti 9357, 26.06.2003, APP; F. Conti, D. Tinti 9509, 01.07.2003, APP);

Canyon del fiume Tara, da Đurđevića Tara a Crna Poda, 19.42703E, 43.01055 N, 600 m, substrato calcareo, 600 m (D. Lakušić, F. Conti, G. Tomović 9031, 11.07.1996, APP);
 Durmitor, Zminjičko jezero, 19.23893 E, 43.10976 N, 1300 m, stream in spruce forest (S. Jovanović, M. Mitrović 1846/90, 13.07.1990, BEOU as *Senecio erraticus*);
 Durmitor, Govede jezero lake, 19.10391E, 43.19175 N, 1500 m, clearing in spruce forest, limestone (V. Stevanović 1231/94, 12.08.1994, BEOU as *Senecio erraticus*);
 Durmitor, Ćurevac, 19.09482 E, 43.20173 N, 1600 m, rocky grounds, limestone (D. Lakušić, F. Conti, G. Tomović 716/96, 06.07.1996, BEOU as *Senecio erraticus*);
 Durmitor, Canyon of river Sušica (above lake), 18.99648E, 43.18668 N, 1200 m, *Fago-Abieto-Piceetum mixtum*, limestone (D. Lakušić, S. Pavić, N. Benić 513/94, 15.07.1994, BEOU as *Senecio erraticus*);
 Durmitor, Sušičko jezero lake, 19.00025E, 43.17826 N, 1100 m, pasture, limestone (S. Jovanović, Z. Bulić, S. Vukojičić 698/94, 15.07.1994, BEOU as *Senecio erraticus*);
 Durmitor, Nedajno-Canyon of river Sušica (edge), 18.99312E, 43.19084 N, 1300 m, rocky grounds, limestone (D. Lakušić, Z. Bulić 626/94, 18.07.1994, BEOU as *Senecio erraticus*).

So far, in the Apennine and the Balkan Peninsula, *J. vulgaris* subsp. *gotlandica* was known only from Greece (Alexandroupolis, Nomos Evrou, 41.119 N, 25.390 E, P. Lassen & al. 1078268, 2002, LD). The new findings in Italy and Montenegro represent the SW limits of the distribution area of the taxon (Fig. 1). Based on our new

data, and on the basis of general distribution data of this taxon (WYSK et al. 2009), we can assume that *J. vulgaris* subsp. *gotlandica* is more widespread in the south and southeast Europe.

It is considered a southeast European steppe floristic element. The new findings enrich the already consistent steppe contingent of central Italy and testify to connections between central Italy and east European-Asiatic steppes.

REZIME

Jacobaea vulgaris subsp. *gotlandica* (Compositae), nova vrsta za Italiju i Crnu Goru

Fabio CONTI, Fabrizio BARTOLUCCI, Gordana TOMOVIĆ, Dmitar LAKUŠIĆ

Jacobaea vulgaris Gaertn. subsp. *gotlandica* (Neum.) B. Nord. (*Senecio jacobaea* L. var. *gotlandicus* Neumu.) je do skora smatrana endemičnim taksonom švedskih ostrva Oland i Gotland. Novijim istraživanjima dijagnostičkih karaktera koji definišu unutarspecijske taksonе u okviru *J. vulgaris* utvrđeno je da je ova podvrsta u Evropi znatno šire rasprostranjena (konstatovana je u Rusiji, Austriji i u Grčkoj), nego što se ranije smatralo. Revizijom herbarijumskog materijala ovog kompleksa u Herbarijumskim zbirkama BEOU, CAME i APP ustanovljeno je da je *J. vulgaris* subsp. *gotlandica* prisutna i u Italiji i Crnoj Gori, što predstavlja nove nalaze za ove države. U radu su prikazani detaljni podaci o novim horološkim nalazima, i data je areal karta sa distribucijom taksona *J. vulgaris* subsp. *gotlandica* na području Apeninskog i Balkanskog poluostrva.

Ključne reči: *Jacobaea vulgaris* subsp. *gotlandica*, Italija, Crna Gora, rasprostranjenje
